Digital Literacy Project Report

Student Information

Name: Hitansh
Registration Number: 25BAI11433
Year: 1st year
Branch: CSE AI/ML
Course: CSE0001 – Digital Literacy
Date: 31st March 2026

Introduction

This project focuses on understanding how digital technologies and online platforms are used in everyday academic and professional activities. The main objective of the project is to explore different aspects of digital literacy, including the use of digital tools, responsible online behavior, professional communication, and awareness of cyber threats.

The scenario of this project is based on a student learning how to use various digital platforms in a responsible and effective way. Through different tasks, the student creates an infographic explaining digital literacy concepts, builds a digital portfolio on platforms like GitHub, solves a beginner coding challenge on HackerRank, and creates a digital awareness quiz using Google Forms.

The project also includes writing professional emails and studying a cybercrime case to understand how online fraud can occur and how it can be prevented. Overall, the activities in this project demonstrate how students can use digital technologies effectively while maintaining safe and responsible practices in the online environment.

Task 1 – Digital Literacy Infographic

In the first task, an infographic explaining the concept of digital literacy was created. The infographic presented important topics such as safe internet practices, protecting personal data, responsible social media use, and maintaining a professional digital presence. A design tool was used to organize the information visually so that it could be easily understood by students.

The purpose of this task was to present important digital literacy concepts in a clear and engaging format. Infographics are useful because they simplify complex information and make it easier for people to remember important ideas related to online safety and responsible technology use.

Task 2 – Student Digital Portfolio

The second task involved creating a student digital portfolio using professional platforms. Accounts were created on GitHub, LinkedIn, and Kaggle to showcase learning activities and digital skills. A special repository profile README was created on GitHub that includes personal details such as name, branch, year, and learning goals.

Creating a digital portfolio helps students build a professional identity online. It allows them to share projects, achievements, and skills with others. This task helped in understanding how digital platforms can be used to present academic work and professional interests effectively.

Task 3 – Coding and Collaboration Platforms

In Task 3, a beginner-level coding problem was solved on HackerRank. HackerRank is an online platform where students and programmers can practice coding problems and improve their programming skills. Solving the "Solve Me First" problem helped in understanding how coding challenges work and how solutions can be submitted and evaluated online.

In addition to coding practice, a Digital Literacy Awareness Quiz was created using Google Forms. The quiz included multiple-choice and short-answer questions related to online safety, password security, and responsible use of digital platforms. This task demonstrated how digital tools can be used for both learning and assessment purposes.

Task 4 – Email Etiquette

Task 4 focused on professional email communication and responsible social media behavior. Two professional emails were written to demonstrate correct email format, including a subject line, greeting, message body, and closing signature.

A social media Do's and Don'ts checklist was also created to promote responsible online behavior. The checklist included tips such as avoiding offensive posts, protecting personal information, verifying information before sharing, and maintaining respectful communication online. This task highlighted the importance of proper digital communication skills.

Task 5 – Cybercrime Awareness

The final task focused on cybercrime awareness. A case study was written on UPI payment fraud, which is a common cybercrime where scammers trick users into approving payment requests and unknowingly transferring money to the attacker.

The case study explained what the crime is, how it typically happens step by step, who is usually targeted, and what consequences victims may face. A prevention checklist was also created with safety tips such as verifying payment requests, never sharing OTPs, using strong passwords, and reporting suspicious activities to cybercrime authorities.

Understanding cybercrime is an essential part of digital literacy because it helps individuals recognize online threats and protect themselves while using digital platforms.

Conclusion

The Digital Literacy Project provided practical experience in using digital tools responsibly and effectively. Through the different tasks, important skills such as creating digital content, building a professional online presence, solving coding problems, communicating through email, and understanding cybercrime risks were learned.

These skills are essential for students in today's digital world. The knowledge gained through this project will help students use technology safely and confidently in both academic and professional environments.
